1. INTRODUCTION

Sabourin Kimble & Associates Ltd. have been retained by Venetian Group Ltd. to complete a detailed Stormwater Management Design Brief in support of the detailed design for redevelopment of the lands at 231 to 249 Reach Street in the Township of Uxbridge. The subject site is located on the north side of Reach Street just east of Coral Creek Crescent/Testa Road, as shown in Figure 1.0.

The purpose of this report is to provide municipal servicing and stormwater management information to address site storm drainage conveyance and capture and stormwater management for the proposed development.

2. MUNICIPAL SERVICES

2.1 Site Grading

As shown in drawings SG-1 through SG-3 specific grading is required to support the development concept. The interior roads have been graded to collect overland flow at a low point adjacent to the proposed woodlot at the northwest limit of the site. The capacity of the downstream storm drainage system has specific flow targets for this site and as such, it is proposed to capture all overland flows within the site and convey them to the outlet via the storm sewer system. Prior to discharge to the downstream receiving storm sewer, the flows will be controlled on-site to the required targets. Further details with respect to on-site overland flow capture and associated stormwater management controls are provided in the following sections of this report.

2.2 Storm Drainage

The storm sewer design for the Estates of Avonlea subdivision to the north, made allowance for external uncontrolled flow (reaching the northwest limit of the subject site) of approximately 0.38 hectares at a runoff coefficient of 0.35. This flow was anticipated to discharge via a rear yard catchbasin from Lot 30 to the Village Green Lane storm sewer. This downstream development has also sized the municipal storm sewers and communal Stormwater Management Pond to accommodate the site using a runoff coefficient of 0.45 and an overall area of 1.65 ha. A servicing block at the northeast corner of the subject site connects to Village Green Lane. The allowable storm discharge from the site was identified as 221 l/s and 414 l/s for the 5 year and 100 year storms respectively as shown on the Avonlea Estates storm drainage boundary plans (Appendix A). Therefore, adequate stormwater management controls must be implemented on the subject site to meet the downstream capacity constraints. The details of those controls are outlined in the following sections.

As shown in drawings SS-1 through SS-3 the entire site will be serviced by a storm sewer system which outlets to the existing 525mm diameter storm sewer on Nelkydd Lane. The internal storm sewers have been sized to convey the 5 year and 100 year storm flows to the outlet of the site. A runoff coefficient of 0.75 for the multi-family residential portion of the site, 0.85 for direct roof connections and 0.25 for the remaining open space plus the external drainage area was applied as per the Township of Uxbridge design criteria. The site storm drainage will be controlled to a

maximum flow of 221 l/s for the 5 year storm and 414 l/s for the 100 year storm as per the requirements of the downstream storm drainage system. Details of the stormwater management controls are provided in Section 4.0 of this report.

Overland drainage from the rear yards adjacent to the existing subdivision and the existing woodlot at the northwest corner will outlet to the existing rear yard catchbasin within the downstream subdivision. The combined coverage and drainage area is equal to that anticipated in the Village Green Lane design as outlined in the supporting design calculations (Appendix B).

A storm sewer design sheet and storm drainage plan have also been provided in Appendix C.

3. STORMWATER MANAGEMENT

3.1 Stormwater Management Criteria

The stormwater management approach for the site must meet the overall stormwater management criteria as established in the LSRCA Technical Guidelines for Stormwater Management Submissions (2016) and the requirements of the Township of Uxbridge as summarized in Table 1.

TABLE 1
OVERALL STORMWATER MANAGEMENT CRITERIA

Control	Criteria
Water Quality	• Enhanced fisheries protection as outlined in the MOE Stormwater Management Practices Planning and Design Manual. • Minimize phosphorous loading according to the Lake Simcoe Protection Plan and offset any increases in phosphorous loading in keeping with the Lake Simcoe Phosphorous Offsetting Program (2017).
Erosion Control	• As outlined in the Uxbridge Brook Watershed Plan (February 1997) the extended detention of the 40mm storm runoff for a minimum of 24 hours.
Water Quantity	• Control post development flows to pre-development levels for the 2 through 100 year storms. • As per the downstream subdivision design, control the site discharge to the downstream storm sewer to 221 l/sec for the 5 year design storm and 441 l/sec for the 100 year design storm. • Maintain or reduce the equivalent discharge to the rear yard catchbasin at existing lot 30 (downstream subdivision) to the area and coverage provided in the storm sewer design. • Control stormwater runoff volumes such that, the post-construction runoff volume shall be retained on site from runoff of the first 25 mm of rainfall from all impervious surfaces on the site. • Maintain safe conveyance of flows to sufficient outlets without negative impacts on adjacent properties.
Water Balance	Maintain the pre-development water balance under post development conditions.

3.2 Stormwater Management Concept

The stormwater management approach has been developed to reflect the Stormwater Management Guidelines outlined in Table 1 and the infiltration capacity of the site. The on-site soils are predominately sand with high infiltration capabilities (refer to section 3.3). Therefore, it is proposed to infiltrate a volume equivalent to the 40mm storm runoff from all impervious surfaces. It is proposed that these works will adequately address the overall stormwater management criteria for water quality control, erosion control and the runoff volume control as outlined in Table 1. Additional water quantity storage will be provided to adequately address the limited capacity of the downstream receiving system. The entire system has also been reviewed by Palmer Environmental as it relates to site water balance and phosphorous loading (a summary of that assessment is provided in section 3.6).

Infiltration galleries combined with perforated storm sewers plus rear yard infiltration swales will provide sufficient infiltration capacity as shown in drawings SS-1 through SS-3. Specific and distinct infiltration systems will be provided throughout the site as shown in SD-3. When the infiltration capacity is reached, rear yard LID areas 1, 2, 4 and 5 will overflow into the perforated storm sewer system for additional controls. Rear yard LID area 3 will outlet to the existing woodlot when the infiltration capacity is reached. The internal perforated pipe system plus the centralized facility are completely linked and dendritic in nature to provide adequate infiltration capacity for the remainder of the site. The infiltration capabilities of the granular cisterns will be supplemented by extra depth topsoil (0.3 m minimum) on all lawn and landscaped areas. Roadway catchbasins have been strategically located to maximize contributions from rooftops and rear yard/landscape areas. All road drainage will be pre-treated through an oil/grit separator prior to discharge to any infiltration facilities.

Flows in excess of the 40mm runoff event up to the 100 year storm event will be controlled for water quantity purposes by orifice plates located in the downstream most manhole. The water quantity storage volume will be provided in a portion of the contributing storm sewer system plus three centralized open bottom underground ADS storage chamber systems situated at strategic locations within the site.

Allowable release rates, post development flows and runoff volumes have been evaluated at the site outlet. The technical details of the proposed stormwater management system are provided in the following sections.

3.3 Supporting Study

In March, 2019, Palmer Environmental Consulting Group Inc. completed a detailed hydrogeologic investigation on the site which included six (6) boreholes with three (3) monitoring wells. Boreholes were drilled to depths of up to 8.0 metres. Through the monitoring period the boreholes and monitoring wells remained dry. As a result, the monitoring was expanded to include five (5) existing private wells located within the site boundary. Monitoring of these wells concluded that the ground water levels were between 10 and 15 metres below existing ground elevations. The monitoring is on-going and will be updated as the development process proceeds. These ground water elevations were monitored over the course of one (1) year and were considered to be stable with very little fluctuation. The report identified that seasonal variations of 0.2-0.4 metres may be expected.

A representative percolation rate was determined empirically based on the geometric mean of hydraulic conductivity valuations for two (2) locations within the site. The empirical calculation was supported by field testing utilizing the Guelph Permeameter in five (5) different test locations. The resulting representative infiltration rate was determined to be 72 mm/hr and was subject to a safety factor of 2.5. Therefore, a percolation rate of 28.8 mm/hr was utilized in the design of the LID system.

A detailed summary of the hydrogeologic investigation and findings is provided in the Palmer report provided under separate cover.

3.4 Stormwater Quality/LID Controls

Water quality and infiltration facilities have been distributed throughout the site as shown in SD-3, Runoff from 50% of the roof area within rear yard LID areas 1 through 5 will be directed to the surface at the rear of each housing unit. This runoff will combine with overland flow from the rear yards and discharge to swales located along rear property line. The flow from the swales will be captured by rear yard catchbasins and discharged into a granular trench located beneath

the swale. The granular trenches have been designed with sufficient storage volume to accommodate the equivalent of 40mm of runoff from the contributing roof areas. Sufficient contact area has been provided to accommodate draindown of the storage volume within a 24 hour period. An overflow outlet will be provided on each granular gallery should they become full. Rear yard LID areas 1, 2, 4, and 5 will overflow into the storm sewer system within the road for further water quantity control. Rear yard LID area 3 will overflow into the woodlot located at the northwest limit of the site. A detail of the rear yard LID system is provided in drawing SD-3

The remainder of the site will contribute runoff to an internal perforated storm sewer and centralized storage facility with sufficient granular storage capacity to accommodate 40mm of runoff from the remaining roof areas and all of the surface impervious areas (roadways and driveways). Granular galleries will be provided at the bottom of the perforated sewers and under the centralized storage area. The galleries are proposed in a dendritic fashion following the storm sewer routing such that continuous storage volume is always available. It is proposed that the remaining front roof areas (50%) of the units adjacent to rear yard LID's plus 100% of the remaining roof areas be directly connected to the perforated storm sewer system. Road drainage will be captured via catchbasins in a conventional manner with pre-treatment of the flows with strategically located oil/grit separators. The granular galleries under the roadway have been designed with sufficient contact area to ensure a draindown time of 24 hours. The centralized open bottom facility has been designed in four (4) locations. The draindown time of the granular under the main centralized open bottom facility is 48 hours. A detail of the perforated storm sewer granular galleries is provided in drawing SD-3

The contributing drainage areas and corresponding storage volumes are summarized in Table 2.

TABLE 2
ON-SITE WATER QUALITY/INFILTRATION VOLUMES

Drainage Area	Total Contributing Drainage Area (ha)	Total Impervious Area (ha)	Required Storage Volume (m^3)	Storage Volume Provided (m^3)
*Rear Yard LID 1	0.14	0.10	42.0	41.5
**Rear Yard LID 2	0.30	0.23	90.0	91.8
Rear Yard LID 3	0.11	0.08	33.0	33.2
Rear Yard LID 4	0.06	0.04	17.0	13.8
Rear Yard LID 5	0.08	0.06	25.4	16.9
Perforated Storm Sewers &Central Facility	1.93	1.51	600.6	610.8

**External area contributing to the LID but not included in the calculation is 1.0 ha from outside of subject property.*
***External area contributing to the LID but not included in the calculation is 0.83 ha of woodlot from within subject site and 0.44 ha from outside of the subject site.*

Calculations in support of the water quality/infiltration design are enclosed in Appendix D.

3.5 Stormwater Quantity Controls

It is assumed that the water quality/infiltration works provided will adequately address all water quality and erosion control requirements for the site. Any flow in excess of these systems will be conveyed by the storm sewers to water quantity control orifice plates located in manhole 24. All major system flows will be captured into the storm sewer system on-site and will also be conveyed to manhole 24. The surface flow capture analysis is summarized in section 3.7.

Initially, the extended rational method was utilized to determine the storage volume required to meet the downstream flow requirements. The combination of a 219mm and 379mm diameter orifice plate at different elevations was determined to control the discharge from the developed area such that post development flows meet the 5 year storm flow target of 221 l/s and the 100 year storm flow target of 414 l/s. The orifice plate controls result in a maximum 100 year storm storage volume of 679 cubic metres at a maximum ponding elevation of 279.30 metres. The storage volume will be provided within the storm sewers and in a ADS Storm Chamber open

bottom storage systems located strategically within the site. The resultant storage volume and ponding elevations for each return period storm are summarized in Table 3.

TABLE 3
ON-SITE WATER QUANTITY STORAGE VOLUMES

Storm	Maximum Water Surface Elevation (m)	Peak Discharge Rate (m^3/s)	Storage Volume in Storm Sewer System (m^3)	Storage Volume in ADS Storm Chamber System (m^3)	Total Storage Volume (m^3)
5 year	278.30	0.088	29	164	193
100 year	279.30	0.414	87	592	679

Calculations in support of the water quantity control system are enclosed in Appendix E.

3.6 Confirmation of Existing Stormwater Management Pond Operation

The post development hydrologic model for the Estates of Avonlea subdivision was utilized to confirm that the storage and flow controls provided on the site would not alter the operation of the downstream stormwater management facility. The subject site and associated storage characteristics as summarized in the previous sections were inserted into the hydrologic model for the Avonlea SWM facility and the results of that evaluation are summarized in Table 4.

TABLE 4 HYDROLOGY MODEL OUTPUT SUMMARY ESTATES OF AVONLEA SWM FACILITY				
Storm Event	**Required Volume (m^3)**	**Target Peak Flow (m^3/s)**	**Resultant Volume (m^3)**	**Resultant Peak Flow (m^3/s)**
5 Year	3,757	0.16	3,680	0.14
25 Year	4,946	0.50	4,907	0.48
50 Year	5,416	0.67	5,397	0.66
100 Year	5,912	0.86	5,919	0.86

As shown in Table 4, the on-site storage provided does not impact the operation of the existing Estates of Avonlea stormwater management. Details of the Estates of Avonlea stormwater management pond review are provided in Appendix B.

3.7 Surface Flow Capture Assessment

The OTTSWM hydrologic model was utilized to determine the infrastructure required to safely capture the 100 year flow from the site into the storm sewer/storage system. The evaluation examined the runoff generated from the site, the ability of the roadways to pass the overland flow and the capture capabilities of on-site catchbasins. All localized low points were evaluated to ensure that adequate capture occurs and any resultant surface ponding does not impact any residential units.

The evaluation determined that three (3) additional double catchbasins will be required at the internal low point located at the northeast limit of the site. With this additional infrastructure, the 100 year storm overland flow will be safely captured by the storm sewer/storage system.

A complete summary of the OTTSWMM analysis is provided in Appendix F.

3.8 Water Balance and Phosphorus Assessment

Palmer Environmental Consulting Group completed a detailed assessment of water budget and phosphorus generation for the site under existing and proposed conditions. Each assessment evaluated the effectiveness of the proposed LID's in maintaining water balance for the site and reducing phosphorus generation.

The pre-development and post development water budget was completed for the overall study area using a monthly soil-moisture balance approach (Thornthwaite and Mather, 1957). The water balance calculations estimate average annual evapotranspiration (evaporation and plant transpiration) using factors such as monthly precipitation, temperature and latitude. The average available water surplus, which is the water available for infiltration and runoff purposes, was calculated by subtracting the average annual evapotranspiration from the average annual precipitation. Based on soil conditions at the site, a soil moisture retention value of 150 mm was utilized to represent the soil type and vegetation cover. The resulting annual water surplus was then partitioned using infiltration coefficients based on MOEE (1995) and modified based on site specific conditions. This approach takes into consideration three factors: topography/slope, soil type, and land cover, which are summed to provide a representative infiltration factor for the area.

The pre-development water budget resulted in total runoff of 3,087 m^3/yr and total infiltration of 10,451m^3/yr. Under post development conditions, the provision of the proposed LID works results in total runoff of 3,899 m^3/yr and total infiltration of 19,044 m^3/yr. The provision of the distributed LID works throughout the site result in a slight increase in site runoff and a net increase in infiltration of approximately 82%.

The Lake Simcoe Phosphorus Offsetting Program (LSPOP) requires that all new developments must control 100% of the phosphorus from leaving their property. Based on the Lake Simcoe Region Conservation Authority (LSRCA) Phosphorus Offsetting Policy and the MECP Phosphorus Budget Tool (V2.0 Release Update – March 30, 2012) PECG estimated the pre- and post-development phosphorous budget for the site.

Based on the existing cover for the site, the pre-development phosphorus load was calculated to be 0.35 kg/yr. Palmer evaluated the effectiveness of the proposed distributed infiltration works for the site including an twelve (12) month construction period and determined that the total post development phosphorus loading would be 0.22 kg/yr. This represents a 39% reduction in phosphorus loading under post development conditions.

The detailed calculations and finding are contained with the Hydrogeological Assessment which has been provided under separate cover.

4. EROSION AND SEDIMENTATION CONTROL MEASURES

During construction of any portion of the subject lands adequate erosion and sedimentation controls must be implemented to safeguard them against potential impacts. In support of the detailed design for this development proposal, a comprehensive construction erosion and sedimentation control plan has been prepared. This plan includes the provision of the following works as outlined in drawings ESC-1 through ESC-5:

- Sediment control fencing around the perimeter of the site including double sediment fence with an intermediate straw bale installation adjacent to all existing sensitive natural features,
- Construction mud mat at the designated entrance to the site,
- Silt sacks on all road catchbasins,
- Catchbasin sediment traps on all rear yard catchbasins,
- Removal of all topsoil from the site for the duration of underground and house construction
- Strategic review protocol for all sediment control works during the construction period.

Sedimentation control practices will be implemented for all construction activities within the Study Area, including tree removal, topsoil stripping, underground sewer construction, road construction and house construction. Sedimentation control measures are to be installed and operational prior to any construction activity, and are to remain in place until such time as the residential dwellings are constructed and the lot grading complete with established sod.

5. CONCLUSIONS

Based on the findings of this Stormwater Management Design Brief, the following conclusions were reached:

- The subject lands should be developed as townhouse residential land use,
- The style of development requires specific grading that may be accommodated on this site,
- The proposed infiltration works and the existing soil characteristics provide sufficient capacity to retain and infiltrate the runoff volume from a 40mm design storm over the contributing impervious area,
- The water quantity storage system provided will control post development flows to specific flow targets at the site outlet,
- Appropriate infrastructure has been provided to capture and control the 100 year storm flows from the site to allowable rates,
- The on-site stormwater management works are sufficient to ensure that the downstream stormwater management facility located within the Estates of Avonlea subdivision will continue to operate as designed
- The proposed LID program will be effective in maintaining the post development to pre-development water balance and will result in a lower phosphorus

Hydrologic Model Summary

Runoff Volume Summary (Model Verification)

Hydrograph Area (ha)	100 Year Runoff Volume - Burnside (mm)	100 Year Runoff Volume – SKA (mm)
17.39	41.243	41.24
13.00	22.555	22.55
1.00*	57.577	57.53
6.26	42.797	42.80

*Cannot input '0.0' as slope in Visual OTTHYMO

Peak Flow Summary

Storm	Pre-Development	"Ultimate" Model (Burnside)		"Ultimate" Model (SKA)		Post-Development Model (SKA)	
	Peak Flow (cms)	Peak Flow (cms)	Volume (m^3)	Peak Flow (cms)	Volume (m^3)	Peak Flow (cms)	Volume (m^3)
5 Year	0.35	0.16	3757	0.16	3746	0.14	3679
25 Year	0.62	0.50	4946	0.50	4958	0.48	4904
50 Year	0.74	0.67	5416	0.68	5439	0.66	5396
100 Year	0.88	0.86	5912	0.87	5959	0.86	5912

The Stormwater Management Design for 'Estates of Avonlea' by Coral Creek homes by Burnside Vincent Associates was reviewed. The modelling of contributing external areas, namely 'Area G', were underestimated in terms of both size and coverage under post development conditions. The SWMHYMO hydrologic assessment was remodelled using Visual OTTHYMO 6.0 to assess the impact of the additional area contributing to the pond under true post development conditions. Required pond volume and pond outflow rate were the focal points of this assessment.

When modelled in VO6, the 'Ultimate' site condition (i.e. the model using the assumptions made in the Avonlea SWM Report) produced flows and volumes that are similar to the SWMHYMO model (Summarized under "Ultimate" Model (Burnside) in the Peak Flow Summary table above). The VO6 results are summarized under the "Ultimate" Model (SKA) column in the Peak Flow Summary table above. The runoff volumes were assessed for both models to ensure hydrograph and rainfall parameters were input correctly (see above Runoff Volume Summary - Model Verification).

The VO6 model was then updated to reflect true post development conditions, incorporating representative site coverage, external areas and on-site storage. The storage-discharge curve used for the subject site was based on two requirements:

1) Allowable storm discharge from the subject site was identified as 221 l/s and 414 l/s for the 5 year and 100 year storms.
2) The peak flow and volumes produced from the “Post-Development Model (SKA)” should be equal to or less than the peak flow and volumes produced from the “Ultimate Model (Burnside)”

In order to satisfy requirement #1, the extended rational method was used to determine the amount of on-site storage needed and two orifice plates were sized to control the 5 year and 100 year storm event. The storage-discharge curve was then updated in the VO6 model and the results showed that the peak flow and volumes produced from the “Post-Development Model (SKA)” was greater than the peak flow and volumes produced from the “Ultimate Model (Burnside)”, thus requirement #2 was not met. Adjustments were made to both orifice plates to further restrict the proposed sites discharge until requirement #2 was satisfied while maintaining requirement #1.

The results are summarized under the “Post-Development Model (SKA)” column in the Peak Flow Summary table above. These results show a minor reduction in both pond volume and pond outflow from the “Ultimate” SKA model and the “Ultimate” Burnside model. Under 100 Year conditions, the Post-Development model matches the pond volume and peak flow from the “Ultimate” Burnside model. All models show a reduction in peak flow from pre-development conditions.

“ULTIMATE” MODEL (SKA)

PROJECT :	Reach Street
PROJECT NUMBER :	17:386
CLIENT :	Venetian Group
DATE :	March 2021

NOTES

Town IDF Curve:

$$I_{5YR} = \frac{904}{(t+5)^{0.7880}}$$

$$I_{25YR} = \frac{1234}{(t+4)^{0.787}}$$

$$I_{100YR} = \frac{1799}{(t+5)^{0.810}}$$

Regional IDF Curve:

$$I_{10YR} = \frac{3454}{(t+20)}$$

$$I_{25YR} = \frac{3454}{(t+20)} \times 1.1$$

$$I_{100YR} = \frac{3454}{(t+20)} \times 1.25$$

APPENDIX D
LID Design

Site Description

Total Site Area	**3.62**	**Ha**
Proposed Development Area	2.61	Ha
LSRCA Buffer + Woodlot	0.92	Ha

General Infiltration Requirements

Total Mixed Impervious Surface Area (0.75 coefficient)	19800.0	m^2
Total Roof Impervious Area (0.85 coefficient)	6300.0	m^2
Total Site Impervious Area	20205.0	m^2

Storm to Infiltrate	40	mm
Total Site Volume to Infiltrate	**808**	m^3

Proposed Infiltration

Infiltration Summary

Total Site Volume Required to Infiltrate	808	m^3
Infiltration Volume Provided	879	m^3
Infiltration Volume Achieved	808	m^3
Remaining Volume Required	**0.0**	**m^3**

Perforated Pipe #0
Infiltration Requirements

LID capture area:	0.03	Ha
Total area of imperviousness	212.5	m^2
Volume to infiltrate:	40.0	mm
Target Volume to be infiltrated:	8.5	m^3

Maximum clearstone depth: $d = \frac{PT}{1000}$

Where

P=	28.8	percolation rate of native soil (mm/h)
T=	24.0	detention time (24 hours)
d=	0.69	

$A = \frac{1000\ V}{Pnt}$

Where

A=		Bottom area of trench (m^2)
V=	8.5	runoff volume to be infiltrated (m^3)
P=	28.8	percolation rate of native soil (mm/h)
n=	0.4	porosity of storage media (0.4 for clear stone)
t=	24.0	detention time (24 hours)

P=K/f.s.
K = 72mm/hr infiltration rate
f.s.= 2.5

$A = \frac{(1000)(12.5)}{(12.0)(0.4)(72.0)}$

A= 30.7

Area Available for Infiltration

Contact Area	**21.00**	**m^2**
Depth of clearstone	0.69	m
Trench Volume	**14.52**	**m^3**
Void ratio	0.4	
Total LID Infiltration Volume Available	**5.81**	**m^3**

Total Imperviousness to be infiltrated in downstream LID	**2.69**	**m^3**

Perforated Pipe #1
Infiltration Requirements

Volume to be infiltrated from Upstream Source:	**2.7**	**m^3**
LID capture area:	0.03	Ha
Total area of imperviousness	255.0	m^2
Volume to infiltrate:	40.0	mm
Target Volume to be infiltrated:	10.2	m^3
Total Target Volume Required for LID Infiltration:	**12.9**	**m^3**

Maximum clearstone depth: $d = \frac{PT}{1000}$

Where
P= 28.8 percolation rate of native soil (mm/h)
T= 24.0 detention time (24 hours)

d= 0.69

$A = \frac{1000\ V}{Pnt}$

Where
A= Bottom area of trench (m^2)

Quantity Control Analysis - External Drainage Conditions

Existing Drainage Conditions to External Lands	Area (Ha)	Runoff Coefficient	AR
Drainage Area to Village Green Lane Accounted For By R.J, Burnside	0.58	0.35	**0.203**
Area of R.J. Burnsides AR Estimate Which is Applicable to The Site Area	0.38	0.35	**0.133**

Refer to Storm Drainage Plan in Appendix A, Drawing No ST - 1 by R.J. Burnside & Associates Limited

Proposed Drainage to External Lands	Area (Ha)	Runoff Coefficient	AR
Undeveloped runnoff	0.15	0.25	0.038
Developed runnoff	0.11	0.75	0.083
Total Area	0.26	Total AR=	**0.120**

Therefore, proposed AR is less than the original Estimate from R.J. Burnside & Associates.

Quantity Control Analysis Approach Summary

In order to control the proposed sites storm water quantity as per required, three systems will be used in conjunction:

- StormTech Chamber systems to store the majority of the quantity as per required.
- The proposed storm sewer system pipes for additional storage.
- Orifice plates on the downstream manhole to restrict the flow to the allowable release rate and backup the excess flow into the upstream storage system (previous systems mentioned).

Quantity Control Analysis - Orifice Sizing

ORIFICE 1: 5 YEAR STORM VERTICAL ORIFICE PLATE

Max Allowable Flow	**0.221**	m^3/s
H_{max}	278.30	m
Pipe Invert (Orifice #1 Inv)	277.46	m
C	0.62	
Head	0.73	m
Orifice #1 Diameter	**219**	**mm**

$$Q = CA\sqrt{2gh}$$

Q = (0.620) (0.038) (2 x 9.81 x 0.73 m)
Q = 0.088 m^3/s

The design 5-year flow is less than the allowable, therefore the Orifice 1 sizing is acceptable.

ORIFICE 2: 100 YEAR STORM VERTICAL ORIFICE PLATE

Flow Released through Orlfice 1 at 100 Year Ponding Elevation:

H_{max}	279.30	m
Pipe Invert (Orifice #1 Inv)	277.46	m
C	0.62	
Head	1.73	m
Diameter	**219**	**mm**

$$Q = CA\sqrt{2gh}$$

Q = (0.620) (0.038) (2 x 9.81 x 1.73 m)
Q = 0.136 m^3/s

Max Total Allowable Flow	0.414	m^3/s
5 Year Control Orifice Flow	0.136	m^3/s
Remaining 100-Year Allowable Flow	0.278	m^3/s
Orifice #2 Inv	278.30	m
Head	0.81	m
Orifice #2 Diameter	**379**	**mm**

Q = (0.620) (0.113) (2 x 9.81 x 0.81 m)
Q = 0.278 m^3/s

The design 100-year flow is equal to the allowable, therefore the Orifice 1 and 2 sizing is acceptable.

Quantity Control Analysis - Hydrology Model Output Summary

On-site Storage

Storm Event	Retention Volume		Quantity Storage	
	Storage Used (m^3)	Peak Flow (m^3/s)	Storage Used (m^3)	Peak Flow (m^3/s)
5 Year	870.5	0.00	-	-
25 Year	879.0	0.09	28.0	0.05
50 Year	879.0	0.18	95.0	0.07
100 Year	879.0	0.28	193.0	0.09

Downstream Pond

Storm Event	Pre-Development	"Ultimate" Model (Burnside)		"Ultimate" Model (SKA)		Proposed Post Development Model (SKA)	
	Peak Flow	Volume	Peak Flow	Volume	Peak Flow	Volume	Peak Flow
	(m^3/s)	(m^3)	(m^3/s)	(m^3)	(m^3/s)	(m^3)	(m^3/s)
5 Year	0.35	3,757	0.16	3,746	0.16	3,680	0.14
25 Year	0.62	4,946	0.50	4,958	0.50	4,907	0.48
50 Year	0.74	5,416	0.67	5,439	0.68	5,397	0.66
100 Year	0.88	5,912	0.86	5,959	0.87	5,919	0.86

Therefore, since the proposed design results in less storage required than calculated using the Rational Method, and results in the downstream SWM pond volume and peak flow targets being maintained, the provided quantity control are appropriate.

*Volume is calculated by taking the total volume minus the retention volume provided by Stormtech.

APPENDIX F

OTTSWMM Capture Analysis

100-Year Capture Analysis

A capture analysis was conducted using OTTSWMM to ensure that the sufficient major system capture points are provided to safely capture the 100-year storm event on-site and convey all flows to the minor system storage. Catchment imperviousness, road grades, pipe slopes, pipe diameter and catchbasin locations have been assigned appropriately based on the proposed design. The following assumptions were made in the development of the model:

- Low points capture capacities were calculated using MTOD Design chart 4.19
- Rear yard catchbasins were assumed to capture incoming flows at a 1:1 capture rate

The following section of this Appendix (OTTSWMM Output) shows the model generated output, as well as Manning's calculations for the maximum major system flow the model generated on the flattest road segment (0.7%). As seen in the modelling results, there is no spillage at the low point adjacent to the proposed woodlot at the northwest limit of the site (major system segment 202). Therefore, the system has been sufficiently designed to capture all major system flows under a 100-year storm event and the 100-year flow depth is contained within the curbs.

The following modelling is included:

- VNHGL.in
- VNHGL.ott

VNHGL.OTT

DISCLAIMER AND LIMITATION OF LIABILITIES

PC-OTTSWMM was carefully prepared and tested to ascertain its
effectiveness and correctness. However, the program is supplied
without expressed or implied warranty of any kind, including any
warranty of fittness for a particular purpose.
In no event will the authors or distributer be liable for any damages
whether incidental, consequential or direct in connection with or
arising from the furnishing, performane or use of the program.

********** BASIC PROGRAM LIMITATIONS**********

1. MAXIMUM NUMBER OF COMPUTATIONAL TIME STEPS (NDELTC) IN CARD GROUP 1B = 50
2. MAXIMUM NUMBER OF TIME INCREMENTS FOR RAINFALL HYETOGRAPH (NDELTR) IN CARD GROUP 2A = 100
3. MAXIMUM NUMBER OF PIPES, INCLUDING THE NUMBER OF OUTLETS FROM THE MINOR SYSTEM IN CARD GROUP 3B = 100
4. MAXIMUM NUMBER OF STORAGE UNITS FOR MINOR SYSTEM (UNDERGROUND STORAGE) IN CARD GROUP 4 = 5
5. MAXIMUM NUMBER OF STREET SEGMENT TYPES, FOR THE COMPUTATION OF RATING CURVES(NSSEG) IN CARD GROUP 5A = 10
6. MAXIMUM NUMBER OF PAIR OF POINTS (QAPP(J,I), QCAP(J,I)) DEFINING INLET CAPTURE IN CARD GROUP 6C = 10
7. MAXIMUM NUMBER OF STREET SEGMENTS, INCLUDING OUTLETS FROM THE MAJOR SYSTEM IN CARD GROUP 7 = 100
8. MAXIMUM NUMBER OF STORAGE UNITS FOR MAJOR SYSTEM IN CARD GROUP 8 = 5

```
         9.   MAXIMUM NUMBER OF SUBCATCHMENTS IN CARD GROUP 9E = 100
        10.   THERE CAN BE NO MORE THAN 5 UPSTREAM PIPES CONNECTING TO A PIPE JUNCTION.
        11.   THERE CAN BE NO MORE THAN 5 UPSTREAM STREET SEGMENT CONNECTING
              TO A STREET JUNCTION.
        12.   THE MAXIMUM NUMBER OF OUTLETS FROM THE PIPE SYSTEM IS 5
              (INCLUDING OUTLETS INTO STORAGES).
              THERE ARE NO RESTRICTIONS ON THE NUMBER OF OUTLETS
              FROM THE MAJOR SYSTEM.
        13.   AN OUTLET FROM THE MINOR SYSTEM (FREE OUTFLOW OR OUTLET INTO
              STORAGE) CAN BE CONNECTED TO ONLY ONE UPSTREAM PIPE.
        14.   AN OUTLET FROM THE MAJOR SYSTEM(FREE OUTLET OR OUTLET
              INTO STORAGES) CAN BE CONNECTED TO ONLY ONE UPSTREAM STREET SEGMENT.
        15.   THE RATIO BETWEEN THE TIME INCREMENT FOR CALCULATION
              (NDELTC)/TIME INCREMENT OF RAINFALL HYETOGRAPH(NDELTR) SHOULD
              BE AN INTEGER (GREATER THAN OR EQUAL 1).
        16.   THE MAXIMUM NUMBER OF POINTS(NJC) DESCRIBING THE INLET CAPTURE
              CURVE = 50.
        17.   THE MAXIMUM NUMBER OF POINTS(NSP1(I)) DESCRIBING THE
              MINOR SYSTEM STORAGE-DISCHARGE CURVE = 20
        18.   THE MAXIMUM NUMBER OF UNIT AREA HYDROGRAPH TYPES(NUAH) = 5
```

Manning's Calculator **(Right-of way Flow)**

Job Number: **17:386**
Description:

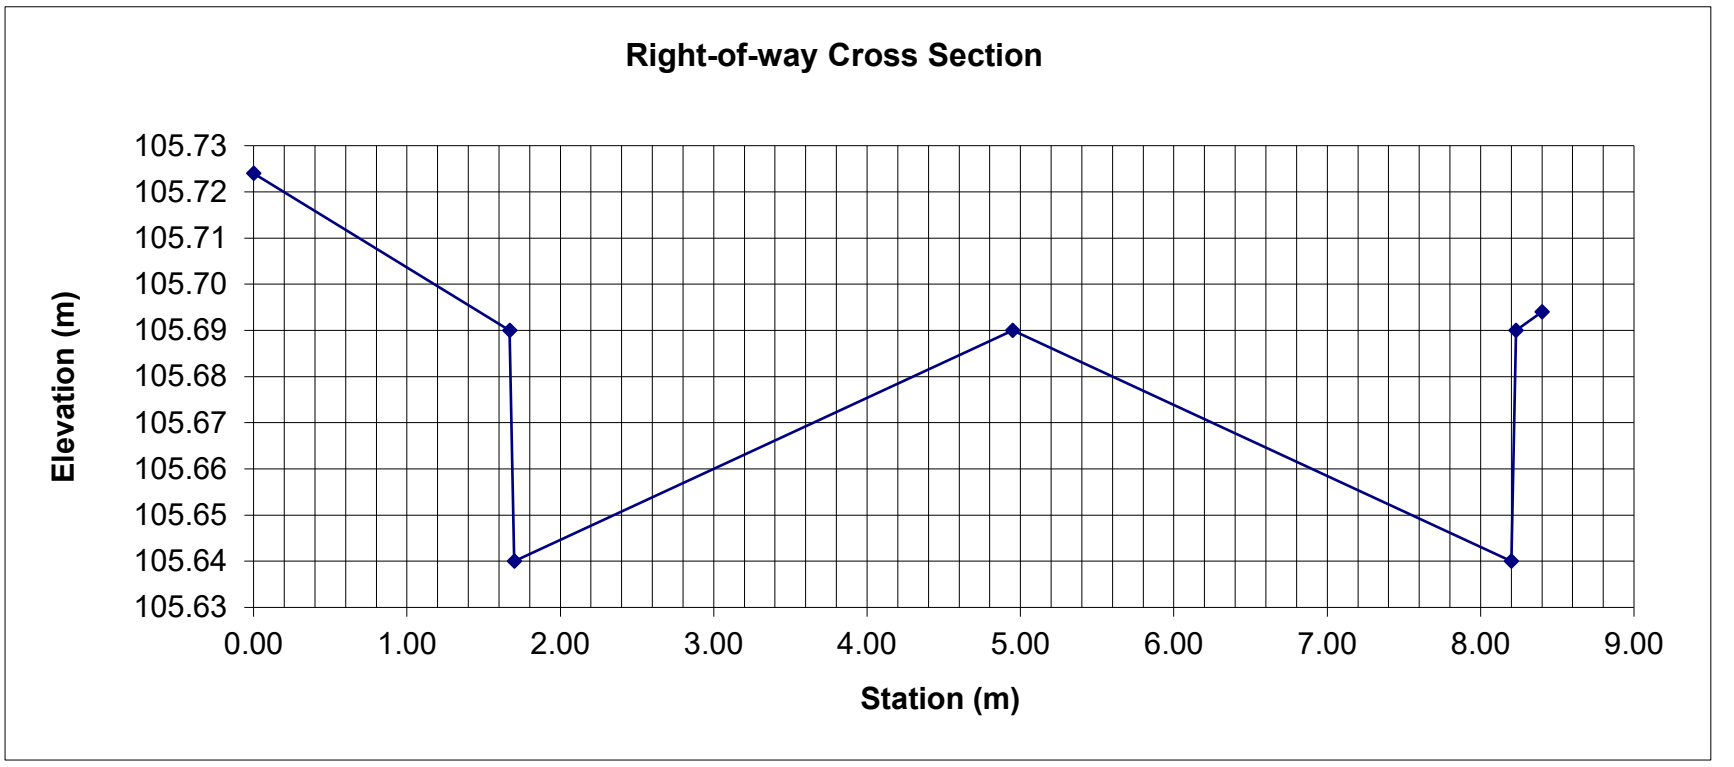
Comparision between the maximum generated OTTSWMM major system flow and ROW capacity of the flattest section of the road in the proposed subdivision

Right-of-way Geometry

			Manning's	
Total ROW width =	8.40	m	0.014	(composite)
Pavement Width =	6.50	m	0.013	
Sidewalk width =	1.50	m	0.013	
Sidewalk BLVD width =	1.70	m	0.035	
Other BLVD width =	0.20	m	0.035	

Road Grade =	0.7000000%
Pavement Cross fall =	2.00%
Sidewalk BLVD slope =	2.00%
Other BLVD slope =	2.00%

Point	Station (m)	Elevation (m)
Sidewalk BLVD	0.00	105.72
Top of Curb	1.67	105.69
Bottom of Curb	1.70	105.64
Centerline	4.95	105.69
Bottom of Curb	8.20	105.64
Top of Curb	8.23	105.69
Other BLVD	8.40	105.69



Flow Capacity

Right-of-way Flow

Area =	0.414	m^2
Wetted Perimeter =	8.640	m
Hydraulic Radius =	0.048	m
Velocity =	0.786	m/s
Flow =	**0.33**	**m^3/s**
